

# TeleClix™ LiveCaster 1.0

## A synchronous MHP playout server

The **LiveCaster** is a system for the multiplexing from the broadcaster to the MHP **Set-Top-Boxes**. Thereby, the reception times of the data can be guaranteed. As a consequence, the design and development of **video synchronous** MHP (Multi-media Home Platform) applications is feasible.

The uniqueness is that the **LiveCaster** works with a **uniform** Java API and can therefore be used for different types of playout servers.

In addition, the **LiveCaster** guarantees a simplified deploying of MHP applications.

The **LiveCaster** offers two different possibilities in order to send the data to the MHP Set-Top-Boxes. With the help of a

**tree structure**, data is sent as long as specified. On the other hand, data can also be sent **only** once at a predetermined time.

The **LiveCaster** enables the broadcasting of various MHP applications. The forthcoming **Football World Cup** or game shows are just a few examples of current projects by TeleClix. Naturally, the **LiveCaster** allows an optimal combination with the

LiveLink system of TeleClix.

Do not lose any time and convince yourself from the **outstanding** features of the LiveCaster.
